CSS : Cascading Style sheets

css files are using for providing styles for html files
css is not a programming lang
css is syntax

How to Write CSS File ?

there are three different ways available for writing css
1. inline style
2. internal style
3. external style

1. inline style sheet ?

writing style inside element called inline stylesheet.
inline stylesheets available in open tag.
inline stylesheets are creating from style attribute.

syn : <p style="values"></p>
one attribute:
<p style="PropertyName:value"></p>

 multiple attributes:
<p style="PropertyName:value;PropertyName:value;
PropertyName:value"></p>

Note :
Attributes separated with semicolon ;

property and value separated with :
inline style is element specific.

2. internal style :

 internal stylesheet is document specific .
 internal styles are creating from style tag
 <style> </style>
internal styles we can provide in head section
commonly.

 <head>
  <style>
  values ,……….
  </style>
  </head

3. External Stylesheet :

External Stylesheet is application level

create a style sheet using   (FileName.css)
File name is not any mandatory name
extension is   .css mandatory

access External Stylesheet file in html

<link rel="stylesheet" href="Filename.css"/>
